

Introducing Mix, the social media platform that's changing the game. Mix is an app that transforms the way users think of and interact with social networking platforms. Our goal is to foster a sense of community among our app userbase. Whether you want to connect with like-minded individuals or explore new communities, our platform provides the tool to do so via group and 'interest-centric' features. With features for content creation, sharing, and networking, Mix is your one-stop shop for social connection. Think of us as a Home Depot for community building – offering a toolbox for the Mix userbase to bring their ideas to life. We've designed user profiles to be a compilation of all of the user's posts across the site, giving each a personal 'blog' feel. Mix provides multi-media posting, which includes images, text, videos, and others. With our team in the second development phase, we are excited to launch in Q2 2023.

As a member of the backend support team, some of my responsibilities have included:

- Integrating Lambda functions with API gateway to access and modify data on RDS and S3
- Use AWS X-Ray Active Tracing to monitor lambda function requests
- Design backend implementations, such as support for direct messaging
- Perform QA with team members to give and receive feedback
- Communication with both backend and frontend team members to quickly fix bugs or clarify data expectations
- Read and interpret AWS documentation
